Although Android 6.0 came out quite a long time ago, many developers still have to deal with the new runtime permission system. Although Google has made it quite easy for developers to adapt to the new runtime permission system, there are still many things that developers need to know about the new runtime permission system.

That's the reason why I decide to blog about the topic today. Everything you need to know about the new Runtime Permission Handling has to happen in a single post, and so I decided to do it here.

The New Runtime Permission

Since Android Marshmallow (Android 6.0) Google has made a major change in the way Android permissions are asked for at install time. Since Marshmallow, the application will be able to ask for all things at runtime. Google has made this change to improve the security and privacy of Android.

So, you may think, why we are so much angry about this change? Well, there are many reasons for this.

Since Marshmallow, Google has made many changes to the permission system to improve the security and privacy of Android. Google has made many changes to the permission system to improve the security and privacy of Android. Google has made many changes to the permission system to improve the security and privacy of Android.
